Mesograf and its Derivatives from Raw Graphite Ore

Grafoid's journey into the industrial production of few layer Mesograf™ graphene from raw, graphite ore from a novel process has led to stunning results. Managing the alignment of human resources, investment capital and physical resources requires strategic planning, determination, R&D hubs and timing. Partnering with like-minded governments and persistent growth in industrial and academic partnerships have led to those collaborations that allow for the joint discovery of new applications and strong networks of support.

Today, our expansion continues with strong interest from academic, government, & industry partners seeking a de-risked nanotechnology and advanced materials company with an international presence and a robust infrastructure that includes multiple production sites. Grafoid is the only diversified graphene company focused on cross-border production driven by application partnerships.
